PREFACE	xv
ACKNOWLEDGEMENTS	xix

PART ONE INTRODUCTION TO THE SPATIAL CONTEXT

Chapter 1 Geomatics: Introduction to spatial information systems	3
1.1 Spatial data organization	3
1.2 Heterogeneity of uses of spatial information systems	10
1.2.1 Uses of spatial information systems	10
1.2.2 Examples of data requirements	12
1.3 Some components of spatial information systems	16
1.3.1 The toolbox view	16
1.3.2 The physical components	19
1.4 The role of automation: geomatics	19
1.5 Bibliography	24
Chapter 2 Needs: Purposes and types of spatial problem	27
2.1 Problems to be solved; tasks to be performed	27
2.2 Location and character	33
2.3 Measurements and spatial relationships	38
2.3.1 Spatial properties	39
2.3.2 Spatial relationships	41
2.4 Categories of spatial problems	43
2.4.1 Types of spatial problem	43
2.4.2 Other aspects	47
2.5 Some examples of multi-faceted needs	48
2.5.1 Example of flows over landscapes	48
2.5.2 Resources inventory	49
2.5.3 Predicting the location of mineral ore deposits	49
2.5.4 Engineering network simulation	53
2.6 Main categories of tools in a spatial information system	54
2.7 Some implications for the design of spatial information systems	58
2.8 Bibliography	59

Chapter 3	Semantics: Objects, surfaces, data	61
3.1	The information in a spatial information system	61
3.1.1	Spatial entities	62
3.1.2	Categories of information	63
3.1.3	Metainformation	67
3.2	Non-spatial attributes	67
3.3	Spatial characteristics of entities	72
3.3.1	Dimensionality of entities	72
3.3.2	Geometric elements	76
3.4	Combinations of entity types	81
3.4.1	Combinations of spatial units	81
3.4.2	Substitutions of spatial units	84
3.4.3	Mixed uses	85
3.5	Continuous variation over and in space	87
3.5.1	A field view of spatial variations	87
3.5.2	Isotropy	90
3.5.3	Discrete and continuous views	91
3.6	Spatial and non-spatial properties together	92
3.7	An introduction to the mechanics of spatial data organization	95
3.7.1	Tables and matrices	95
3.7.2	Maps	96
3.7.3	Data models	98
3.8	Personal spatial semantics	99
3.9	Some other aspects of spatial information	102
3.9.1	Data quality	103
3.9.2	The time element	104
3.9.3	Intensional and extensional data	106
3.9.4	General discussion	106
3.10	Bibliography	108

PART TWO GEOMETRIES FOR SPATIAL DATA

Chapter 4	Geometries: Position, representation, dimensions	113
4.1	Different geometries	114
4.2	Positioning objects in spatial referencing systems	116
4.2.1	Continuous space referencing	117
4.2.2	Referencing for discrete entities	122
4.3	Global reference systems	127
4.3.1	Global referencing	127
4.3.2	Map projections	128
4.3.3	Some examples of global systems	131
4.4	The fundamental element of distance	134
4.5	Coordinates and splines: the representation of lines	140
4.5.1	Line simplification	141

4.5.2	Smoothed lines	144
4.5.3	Some realities of line and polygon representation	149
4.5.4	Intensional and extensional representation of objects	151
4.6	Fractals: a way to represent natural objects	152
4.6.1	Creation of fractal objects	152
4.6.2	Stochastic fractals	155
4.7	Space-filling curves and dimensionality	159
4.7.1	Paths through space	159
4.7.2	Space-filling curves	161
4.7.3	Dimensionality	167
4.8	Summary	170
4.9	Bibliography	172
Chapter 5	Topology: Graphs, areas, ordering	175
5.1	Networks and graphs	175
5.1.1	Graphs	176
5.1.2	Properties of graphs	180
5.2	Graphs and areas	183
5.2.1	Digital line graphs	183
5.2.2	Topological consistency	186
5.3	Error identification	190
5.3.1	Possible conditions in digital maps	190
5.3.2	Some procedures for checking for errors	192
5.4	Polygons and areas	197
5.4.1	Types of areal spatial unit	198
5.4.2	Containment and coincidence	200
5.5	Data for spatial relationships	206
5.6	Some other considerations and summary	211
5.7	Bibliography	214
Chapter 6	Tessellations: Regular and irregular cells, hierarchies	217
6.1	Mosaics, tessellations and lattices	217
6.1.1	Tessellations	218
6.1.2	Lattices	219
6.1.3	Scale and resolution	221
6.2	The geometry of regular tessellations	222
6.3	Fixed spatial resolutions: regular cell grids	226
6.3.1	Data encoding	226
6.3.2	Spatial properties	230
6.3.3	Surface modelling from lattices	231
6.3.4	Structures for grid-cell data	232
6.4	Variable spatial resolution: quadrees	235
6.5	Hierarchical tessellations for a sphere	243

6.6	Irregular tessellations based on triangles	246
6.6.1	Proximal regions	246
6.6.2	Triangulation	247
6.7	Implications for spatial information systems	252
6.8	Bibliography	254
Chapter 7	Manipulations: Interpolations, geometric operations, transformations	257
7.1	Interpolation and extrapolation	258
7.1.1	The interpolation and extrapolation concept	258
7.1.2	Some practicalities	261
7.2	Basic operations on lines and points	264
7.2.1	Line intersections	264
7.2.2	Segment intersections	265
7.2.3	Point-in-polygon procedure	267
7.2.4	Centroid definition	269
7.2.5	Some spatial statistics based on point data	270
7.3	Some operations for polygons	271
7.3.1	Intersection of lines with polygons	272
7.3.2	Union and intersection of polygons	272
7.3.3	Area computation	273
7.3.4	Areal interpolation	275
7.3.5	Shape measures for polygons	276
7.3.6	Polygon clipping	277
7.3.7	Buffer zones	279
7.3.8	Polygon overlay process	280
7.4	Spatial data transformations	284
7.4.1	Changes in dimensionality	285
7.4.2	Changes in position	286
7.4.3	Conflation	290
7.4.4	Changes in topology	291
7.5	Transformations between regular cells and entities	291
7.5.1	Change to regular cells	292
7.5.2	Change from regular cells to vectors	293
7.6	Access to spatial data	295
7.6.1	Access by identifiers and by locators	295
7.6.2	Rectangles and strip trees	296
7.6.3	Sheets and tiles	299
7.6.4	Different forms of spatial address	300
7.7	Summary	302
7.8	Bibliography	303

Chapter 8 Spatial analysis: Attribute data, modelling, integration	306
8.1 Integrating the attribute data	306
8.2 Some operations for planar network entities	310
8.3 Some operations for grid-cell based map overlay modelling	314
8.3.1 Basic operations for grid-cell data	314
8.3.2 Spatial modelling with grid-cell data	318
8.4 Operations for quadtree tessellations	321
8.5 Operations for irregular polygons and for graphs	324
8.5.1 Creating regions	325
8.5.2 Location problem solving	328
8.5.3 Map overlay modelling and analysis	329
8.6 Integration and multiple representation	333
8.6.1 Multiple representation	334
8.6.2 Integration	334
8.6.3 Some examples of public and commercial spatial data organization	336
8.7 Summary and conclusions	343
8.8 Bibliography	345

PART THREE CONCEPTUAL MODELLING FOR SPATIAL DATA

Chapter 9 Design for Information Systems: Methodologies, issues	351
9.1 Database management systems	352
9.2 The ANSI-SPARC design methodology	358
9.3 Conceptual modelling: the entity-relationship approach	362
9.4 Logical modelling: relational databases	366
9.5 Transforming entity-relationship models into relational models	369
9.6 Logical modelling: CODASYL databases	374
9.6.1 The modelling	374
9.6.2 The data definition and manipulation languages	378
9.7 Some issues in entity-relationship and logical modelling	383
9.7.1 Implied relationships	384
9.7.2 Person-made and natural rules	386
9.7.3 Table organization	388
9.8 The process for the design of spatial information systems	391
9.8.1 The information discovery	391
9.8.2 Information system design	393
9.9 Summary	396
9.10 Bibliography	396

Chapter 10 Spaghetti: Conceptual modelling of line-oriented objects	399
10.1 Representation of segments, polylines and mixtilines	399
10.1.1 Segments	401
10.1.2 Polylines	402
10.1.3 Representation of a mixtiline	403
10.2 One-dimensional representation of polygons and areas	403
10.2.1 Isolated polygons	405
10.2.2 Sets of polygons	406
10.3 Modelling for graphs	409
10.4 Conceptual modelling of terrains	411
10.4.1 Gradients, grids and contours	411
10.4.2 Triangulated irregular networks	414
10.5 Representation of polyhedra	416
10.5.1 Simple polyhedra	416
10.5.2 Complex polyhedra	417
10.6 Some examples of vector oriented geomatic models	419
10.7 Summary	424
10.8 Bibliography	425
 Chapter 11 Pizza: Conceptual modelling for areas and volumes	 426
11.1 Regular cell grid representation	427
11.2 Quadtrees	428
11.2.1 Review of the concept of quadtrees	428
11.2.2 Modelling polygons and terrains by quadtrees	430
11.2.3 Extended quadtrees	432
11.3 Pyramid models	436
11.4 Modelling via octtrees	436
11.4.1 Hierarchical and linear octtrees	438
11.4.2 Extended octtrees	438
11.5 <i>Example: modelling of geological objects</i>	441
11.6 Summary	442
11.7 Bibliography	443
 Chapter 12 Spatial Object Modelling: Views, integration, complexities	 444
12.1 Selection criteria for a good representation	444
12.2 External models: synthesis with different representations	445
12.2.1 Standardization of geometric representation	447
12.2.2 Coexistence of several geometric representations	447
12.2.3 An additional step in conceptual modelling	448
12.3 Working with complex features	453

12.4 Semantic data models	456
12.5 Models used in some spatial information systems and databases	460
12.5.1 Commercial spatial information systems software examples	461
12.5.2 National cartographic databases	467
12.6 Issues in representations and conceptual modelling	468
12.6.1 Metadata	469
12.6.2 Database concepts and practical matters	472
12.7 Bibliography	475

PART FOUR SPATIAL DATA RETRIEVAL AND REASONING

Chapter 13 Algebras: Relational and Peano tuple	479
13.1 Features of relations	479
13.1.1 Some properties of tuples	480
13.1.2 The Cartesian product for relations	481
13.2 Relational operators and relational algebra	483
13.2.1 Intersection	483
13.2.2 Union	485
13.2.3 Difference	486
13.2.4 Join	486
13.2.5 Relational projection	487
13.2.6 Restriction	488
13.2.7 Division	488
13.3 Normalization	490
13.3.1 Necessity for normalization	490
13.3.2 Functional dependencies	492
13.3.3 First normal form	493
13.3.4 Second normal form	495
13.3.5 Third normal form	496
13.3.6 Other normal forms and implications for spatial data	496
13.4 Structured Query Language examples in geomatics	497
13.5 Peano relations	507
13.5.1 Peano relations concept	507
13.5.2 Definition of a Peano relation	509
13.6 Conformance levels and extensions	512
13.6.1 First conformance level: well-positioned object	512
13.6.2 Second conformance level: removal of overlaps	515
13.6.3 Third conformance level: compact objects	516
13.6.4 Extension beyond two dimensions	518
13.6.5 Hilbert keys	519
13.7 The Peano-tuple algebra	520
13.7.1 Boolean operators	520
13.7.2 Geometric operators	523

13.7.3 Relational operators	526
13.7.4 Examples of Peano-tuple algebra queries	530
13.8 Summary	531
13.9 Bibliography	532
 Chapter 14 Spatial Queries: Types, algorithms	 534
14.1 The process for spatial queries	534
14.2 Point-in-polygon queries	537
14.3 Region queries	538
14.4 Vacant place queries	541
14.5 Distance and buffer zone queries	543
14.6 Path queries	546
14.7 Examples of multimedia queries	548
14.8 Implications for spatial information systems	553
14.9 Bibliography	556
 Chapter 15 Access and Quality: Spatial indices and integrity constraints	 557
15.1 Indexing	558
15.1.1 Indexing in file management systems	559
15.1.2 Indexing in relational databases	562
15.2 Spatial indexing	563
15.2.1 Indexing by space-filling curves	567
15.2.2 Indexing by quadtrees	569
15.2.3 Indexing by R- and R ⁺ -trees	571
15.2.4 Indexing by other kinds of trees	573
15.2.5 Some practical aspects of spatial indexing	575
15.3 Integrity constraints	576
15.3.1 Basic integrity constraints	576
15.3.2 Spatial data checking	577
15.3.3 Example of a cadastre	578
15.4 The use of topology in creating integrity checking mechanisms	581
15.4.1 The topology of tessellations	582
15.4.2 The topology of networks	583
15.4.3 The topology of digital terrain models	584
15.5 An example of consistency checking for a terrain model	586
15.5.1 Triangulated irregular network representation	586
15.5.2 Regular cell representation	589
15.6 Conclusions about spatial indexing and integrity	590
15.7 Bibliography	592

Chapter 16 Hypermedia: Multimedia spatial information systems and hypermaps	594
16.1 Hyperdocuments	594
16.1.1 Multimedia spatial data	595
16.1.2 The hypermap concept	597
16.2 Multimedia image data	600
16.2.1 Image modelling	600
16.2.2 Physical encoding	601
16.2.3 Dynamic image models	604
16.2.4 Picture object modelling for retrieval	604
16.3 Organization of collections of maps and images	607
16.4 Hypermaps	612
16.4.1 Spatial referencing of hyperdocuments	612
16.4.2 Spatial queries for retrieving hypermap nodes	613
16.4.3 Encoding hypermap spatial references by Peano relations	614
16.4.4 R-trees and map pyramids	614
16.4.5 Navigation in hypermaps	616
16.5 Summary	617
16.6 Bibliography	618
 Chapter 17 Spatial Knowledge: Intelligent spatial information systems	 620
17.1 Towards intelligent spatial information systems	621
17.2 From record-oriented to object-oriented databases	621
17.2.1 Rationale and objectives	622
17.2.2 Classes, subclasses and instances	624
17.2.3 Attributes and data types	626
17.2.4 Inheritance	628
17.2.5 Links between classes and instances	630
17.2.6 Methods	631
17.3 Utilization for geomatics	632
17.4 Object-oriented databases and spatial information systems	635
17.5 Artificial intelligence and expert systems	639
17.5.1 Facts and rules	639
17.5.2 General structure of an expert system	641
17.5.3 Inference engine	642
17.5.4 Metarules	644
17.6 Spatial knowledge representation	644
17.6.1 Spatial facts	645
17.6.2 Spatial relations	645
17.6.3 Spatial metarules	646
17.6.4 Fuzzy spatial knowledge	646
17.6.5 Spatial knowledge from logical deduction	646
17.6.6 Spatial knowledge derived from numerical formulae	648

17.6.7 Examples of spatial process representation	649
17.6.8 Visual knowledge encoding	651
17.6.9 Examples in spatial knowledge engineering	653
17.7 Spatial reasoning in spatial information systems	657
17.7.1 Learning possibilities	658
17.7.2 Logico-deductive and spatial reasoning	659
17.7.3 Example of districting	660
17.8 Summary	665
17.9 Bibliography	667
 AFTERWORD	 671
INDEX	673
